ABSTRACT

Purpose. We aimed to study the efficacy of transvaginal bilateral sacrospinous fixation (TBSF) and its impact on quality of life (QoL) and sexual functions in women affected by second recurrences of vaginal vault prolapse (VVP).

Materials and methods. We performed a prospective observational study on 20 sexually active patients affected by second recurrence of VVP, previously treated with monolateral sacrospinous fixation. TBSF was performed in all the patients. They were evaluated before the surgery and at 12 months follow-up through pelvic organs prolapse quantification (POP-Q) system, Short Form-36 (SF-36) and Pelvic Organ Prolapse/Urinary Incontinence Sexual Questionnaire (PISQ-12).

Results. At 12 months follow-up, 18 of 20 (90%) patients had been cured of their recurrent VVP. No major intra- and post-operative complications occurred. We found a significant
improvement in 4/5 POP-Q landmarks (excluding total vaginal length), SF-36 and PISQ-12 scores.

Conclusion. According to our data analysis, TBSF appears to be safe, effective and able to improve both QoL and sexual functions in patients affected by second recurrence of VVP after previous monolateral sacrospinous fixation.
